I. THEORY

A. Matrix formulation of the discrete one-dimensional Poisson equation

The one-dimensional Poisson equation with Dirichlet boundary conditions is given by equation 1.

$$-\frac{d^2 u(x)}{dx^2} = f(x), \quad x \in (0, 1), \quad u(0) = u(1) = 0 \quad (1)$$

We define the discretized approximation to u to be v_i at points $x_i = ih$ evenly spaced between $x_0 = 0$ and $x_{n+1} = 1$. The step length between the points is $h = 1/(n+1)$. The boundary conditions from equation 1 then give $v_0 = v_{n+1} = 0$. An approximation to the second derivative of u , derived from the Taylor expansion, is

$$\frac{-v_{i-1} + 2v_i - v_{i+1}}{h^2} = f_i \quad \text{for } i = 1, 2, \dots, n \quad (2)$$

where $f_i = f(x_i)$.

Written out for all i , equation 2 becomes

$$\begin{aligned} -v_0 + 2v_1 - v_2 &= h^2 f_1 \\ -v_1 + 2v_2 - v_3 &= h^2 f_2 \\ &\dots \\ -v_{n-2} + 2v_{n-1} - v_n &= h^2 f_{n-1} \\ -v_{n-1} + 2v_n - v_{n+1} &= h^2 f_n \end{aligned}$$

In general, this can be rearranged slightly so that

$$\begin{aligned} 2v_1 - v_2 &= h^2 f_1 + v_0 \\ -v_1 + 2v_2 - v_3 &= h^2 f_2 \\ &\dots \\ -v_{n-2} + 2v_{n-1} - v_n &= h^2 f_{n-1} \\ -v_{n-1} + 2v_n &= h^2 f_n + v_{n+1} \end{aligned}$$

This system of equations can be written in matrix form as

$$\mathbf{A}\mathbf{v} = \tilde{\mathbf{b}}, \quad (3)$$

explicitly

$$\begin{bmatrix} 2 & -1 & 0 & 0 & \dots & 0 \\ -1 & 2 & -1 & 0 & \dots & 0 \\ \vdots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & \dots & 0 & -1 & 2 & -1 \\ 0 & \dots & 0 & 0 & -1 & 2 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ \vdots \\ v_{n-1} \\ v_n \end{bmatrix} = \begin{bmatrix} h^2 f_1 + v_0 \\ h^2 f_2 \\ \vdots \\ h^2 f_{n-1} \\ h^2 f_n + v_{n+1} \end{bmatrix}$$

With $v_0 = v_{n+1} = 0$, the right side reduces to $\tilde{b}_i = h^2 f_i$.

B. Solve matrix equation

In order to solve the tridiagonal matrix below we need to develop an algorithm. As mentioned in the exercise set we first need to do a decomposition and forward substitution.

$$\mathbf{A} = \begin{bmatrix} b_1 & c_1 & 0 & \dots & \dots & \dots \\ a_1 & b_2 & c_2 & \dots & \dots & \dots \\ & a_2 & b_3 & c_3 & \dots & \dots \\ & \dots & \dots & \dots & \dots & \dots \\ & & & a_{n-2} & b_{n-1} & c_{n-1} \\ & & & & a_{n-1} & b_n \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ \vdots \\ \vdots \\ \vdots \\ v_n \end{bmatrix} = \begin{bmatrix} \tilde{b}_1 \\ \tilde{b}_2 \\ \vdots \\ \vdots \\ \vdots \\ \tilde{b}_n \end{bmatrix}.$$

Looking at the first matrix multiplication we get the following expression.

$$b_1 v_1 + c_1 v_2 = \tilde{b}_1 \implies v_1 + \alpha_1 v_2 = \rho_1, \quad \alpha_1 = \frac{c_1}{b_1} \wedge \rho_1 = \frac{\tilde{b}_1}{b_1} \quad (4)$$

Doing the second matrix multiplication we get

$$a_1 v_1 + b_2 v_2 + c_2 v_3 = \tilde{b}_2 \quad (5)$$

If we multiply equation 4 by a_1 , and subtract it from equation 5 the resulting expression becomes

$$\begin{aligned} (b_2 - \alpha_1 a_1) v_2 + c_2 v_3 &= \tilde{b}_2 - \rho_1 a_1 \\ \implies v_2 + \frac{c_2}{b_2 - \alpha_1 a_1} v_3 &= \frac{\tilde{b}_2 - \rho_1 a_1}{b_2 - \alpha_1 a_1} \\ \implies v_2 + \alpha_2 v_3 &= \rho_2 \end{aligned}$$

$$\text{where } \alpha_2 = \frac{c_2}{b_2 - \alpha_1 a_1} \wedge \rho_2 = \frac{\tilde{b}_2 - \rho_1 a_1}{b_2 - \alpha_1 a_1}$$

Noticing the pattern in ρ and α we can generalize the terms.

$$\alpha_n = \frac{c_n}{b_n - \alpha_{n-1}a_{n-1}} \quad \text{for } n = 2, 3, \dots, n-1 \quad (6)$$

$$\rho_n = \frac{\tilde{b}_n - \rho_{n-1}a_{n-1}}{b_n - \alpha_{n-1}a_{n-1}} \quad \text{for } n = 2, 3, \dots, n \quad (7)$$

II. APPENDIX

A. Utregninger til oppgave 3c

Likning

$$\mathbf{B}_0 \cdot \nabla = \frac{B(\theta)}{r(\theta)} \frac{\partial}{\partial \theta}$$

blir

$$\begin{aligned} \mu_0 \rho(\theta) \frac{\partial^2}{\partial t^2} \left(\frac{\xi(\theta, t)}{h_a(\theta)} \right) &= \frac{1}{h_a^2(\theta)} \frac{B(\theta)}{r(\theta)} \frac{\partial}{\partial \theta} \left(h_a^2(\theta) \frac{B(\theta)}{r(\theta)} \frac{\partial}{\partial \theta} \left(\frac{\xi}{h_a(\theta)} \right) \right) \\ \mu_0 \rho(\theta) \left(-\frac{\omega^2 \xi(\theta, t)}{h_a(\theta)} \right) &= \frac{1}{h_a^2(\theta)} \frac{B(\theta)}{r(\theta)} \frac{\partial}{\partial \theta} \left(h_a^2(\theta) \frac{B(\theta)}{r(\theta)} \frac{\partial}{\partial \theta} \left(\frac{\xi}{h_a(\theta)} \right) \right) \\ -\mu_0 \rho(\theta) \frac{\omega^2 \Xi(\theta) e^{i\omega t}}{h_a(\theta)} &= \frac{1}{h_a^2(\theta)} \frac{B(\theta)}{r(\theta)} \frac{\partial}{\partial \theta} \left(h_a^2(\theta) \frac{B(\theta)}{r(\theta)} \frac{\partial}{\partial \theta} \left(\frac{\Xi(\theta) e^{i\omega t}}{h_a(\theta)} \right) \right) \end{aligned}$$

Den tidsavhengige faktoren $e^{i\omega t}$ kan strykes på begge sider siden derivasjonen med hensyn på θ som vist ikke virker på den. Da får vi

$$\begin{aligned} -\mu_0 \rho(\theta) \frac{\omega^2 \Xi(\theta)}{h_a(\theta)} &= \frac{1}{h_a^2(\theta)} \frac{B(\theta)}{r(\theta)} \frac{\partial}{\partial \theta} \left(h_a^2(\theta) \frac{B(\theta)}{r(\theta)} \frac{\partial}{\partial \theta} \left(\frac{\Xi(\theta)}{h_a(\theta)} \right) \right) \\ \text{Deler på } B^2(\theta) \text{ på begge sider} \\ -\frac{\mu_0 \rho(\theta)}{B^2(\theta)} \omega^2 \frac{\Xi(\theta)}{h_a(\theta)} &= \frac{1}{B(\theta) h_a^2(\theta)} \frac{1}{r(\theta)} \frac{\partial}{\partial \theta} \left(B(\theta) h_a^2(\theta) \frac{1}{r(\theta)} \frac{\partial}{\partial \theta} \left(\frac{\Xi(\theta)}{h_a(\theta)} \right) \right) \\ v_A(\theta) &= \frac{B(\theta)}{\sqrt{\mu_0 \rho(\theta)}} \quad \text{gir} \\ -\frac{\omega^2}{v_A^2(\theta)} \frac{\Xi(\theta)}{h_a(\theta)} &= \frac{1}{B(\theta) h_a^2(\theta)} \frac{1}{r(\theta)} \frac{\partial}{\partial \theta} \left(B(\theta) h_a^2(\theta) \frac{1}{r(\theta)} \frac{\partial}{\partial \theta} \left(\frac{\Xi(\theta)}{h_a(\theta)} \right) \right) \end{aligned}$$

III. KODE
